

1. The boiler (steam generator) is an integral part of the wood-burning stove, with the help of which water is heated. It is not independent device, which cannot be used separately .
2. The boiler is made of high-quality stainless steel, AISI 304 according to European standards, and has high corrosion resistance when exposed to water and high temperature.
3. The device is capable of generating dry, superheated steam, which is very beneficial for human skin and health. It also allows you to create optimal humidity and temperature in the traditions of a real wet sauna.
4. It has an optimal volume of 12 liters and combines the functions of a steam generator and a hot water tank. This volume is enough for bathing procedures or for household needs. The water from the tank can be used to feed the stove stones, thus creating moist steam in the sauna room.
5. It has a high steam capacity in the initial stage of steam generation, which provides a larger amount of steam per unit of time
6. The nozzle breaker for the dry steam outlet of the superheater is directed inside the structure, which makes the operation of the steam generator safe even in small rooms.
7. Large, folding handle for easy transportation and maintenance of the steam generator.
8. The steam generator has small transport dimensions and weight.
